

Enable monitoring of MD (software RAID) devices

After you have created the RAID (via YAST):

```
#inserv -d mdadm
```

to have mdadm run as a daemon in the background in the default runlevels (usually 3 and 5) monitoring your devices. Or you can run it manually using

```
#mdadm --monitor --scan --daemonise > /var/run/mdadm
```

this also writes the pid to `/var/run/mdadm` file.

Also, check it by running:

```
#chkconfig -l mdadm
```

```
mdadm          0:off  1:off  2:off  3:on   4:off  5:on   6:off
```
