

How to make a dump of a website

update 20210611 Best Version:

```
wget -m https://
```

original

If you want to make a dump of a website, then you can do:

```
/usr/bin/wget -q --convert-links -E -m http://website.nu.com.mp3
```

```
wget --progress=bar --convert-links -E -m ftp://ftp.studer.ch/Public/
```

Actually, to download a single page and all its requisites (even if they exist on separate websites), and make sure the lot displays properly locally, this author likes to use a few options in addition to -p:

```
wget -E -H -k -K -p http:// /
```

-E adjust extention ???

-H also download from foreign hosts

-p download all page requisites

PvdM version:

```
wget -r -k -K -p http://
```

-r recursive

-k convert links

-K backup converted
