

Using x2x to connect two computers and their screens with one mouse and keyboard

Let's say you have 2 computers:

```
cpu1: 10.0.0.1
```

```
cpu2: 10.0.0.2
```

Let's say cpu1's screen is left to cpu2's screen.

Let's say you want to control cpu1 from cpu2.

~~Let's assume both computers have the same username.~~

1. install x2x on cpu1
2. enter on cpu2

```
ssh -X user@cpu1 'x2x -west -to :0'
```

and leave terminal open.

And that's it!
