

Shaper

Adjust your crossfades

OVERVIEW

Numisys proposes a shaper module, the assistant you need to adjust crossfades during:

- Live broadcast as you do with direct cueing of audio CDs
- Full auto mode, when the system must process crossfades as well as a DJ.

This module is available with the Schedule and On Air software.

FUNCTIONS OF THE SYSTEM

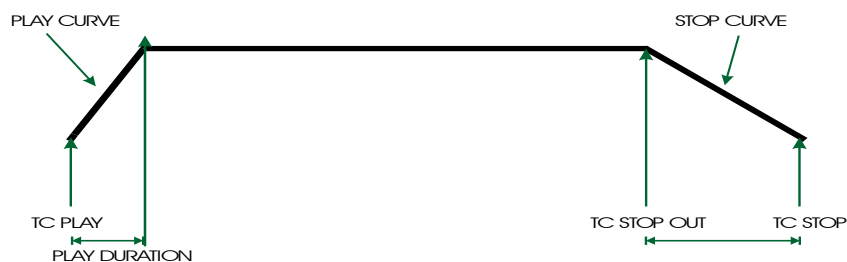

The functions provided are:

- Audio monitoring
- Definition of start/end cue points (Live transmission)
- Selection among 4 configurable sets of fade-in and fade out
- Definition of fade-in, fade-out, link points (Auto transmission)
- Adjustment of audio levels
- Direct link or drag & drop interface with playlists

Use for Live transmission

During live transmissions the shaper module offers

- Pre-listening any music title from the playlist or the database
- Direct cueing to any location in audio
- Loop function for accurate positioning
- Definition of start & stop points

Use for Automatic transmission

After the playlist has been defined and before actual transmission the shaper module offers:

- Direct interface with playlists
- Audio monitoring of crossfades
- Adjustment of start & stop cue points
- Adjustment of link points
- Adjustment of fade-in and fade-out
- Adjustment of audio levels

So the automatic replay is the actual reflect of what you would have done live
